

TrueBlue | • Effective • Appealing • Comfortable

The mask is a crucial determinant of Positive Airway Pressure (PAP) treatment acceptance. Common reasons for non-adherence include pressure intolerance and issues related to the mask, such as facial discomfort, skin injury and significant air-leak.

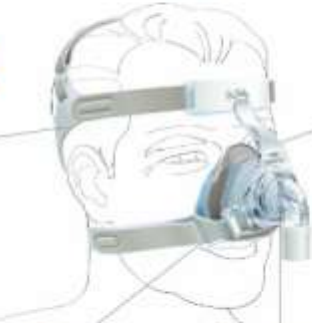

The TrueBlue mask combines the best-in-class gel material and Auto Seal technology to allow for an immediate seal with fewer adjustments. TrueBlue Truly Revolutionary.

Effective

60° flex tabs allow for quick, easy fitting and adjustment.

The original TrueBlue headgear has most adjustment straps that converge into a single side panel with a 1-hour strap for added stability, extra comfort and less movement.

A stabilizer clip at each side allows for straps being tight after night without unnecessary adjustments.

Angled velcro® micro-purse make performance quieter and redirect air away from the seal portion.

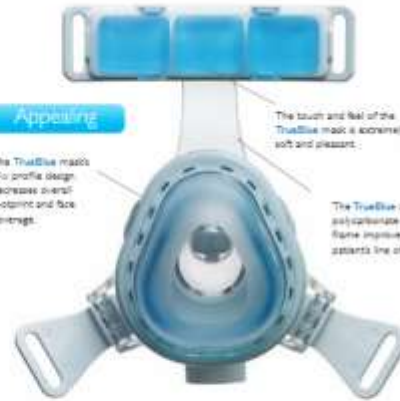

The bilateral balance design follows the patient's movement during sleep, providing great stability throughout the night.

Reference: 1. Efficacy of the TrueBlue mask for overnight treatment of obstructive sleep apnea (OSA).

Appealing

The TrueBlue mask's low profile design decreases overall footprint and face coverage.

The touch and feel of the TrueBlue mask is extremely soft and pleasant.

The TrueBlue clear poly-carbonate frame improves the patient's line of sight.

Comfortable

Traditional mask design is known to create uncomfortable pressure points.

The silicone spring gel cushion and silicone membrane of TrueBlue create a system that feels great comfort.

TrueBlue gel lips prevent leaks by better conforming to the cone structure and contour of the face.

Our premium, low-gel cushions seal quickly and is thinner and lighter than other cushions.

The ultralight, firm-forging outer support cushion membrane creates an effective, self-sealing, leak-free seal.
